

1. Why do you want to be a data scientist/analyst?

I have a strong interest in data science, especially given how quickly technology is changing the industry. I love being a part of new technologies and trying innovative solutions. Afterwards I became particularly interested in artificial intelligence. I learned about machine learning in my studies and was eager to use artificial intelligence in a more practical way. I'm particularly interested in using predictive analytics to instinctively meet customer needs. I know some people are worried about AI automatically collecting data, but in my opinion, AI allows me to focus on the most exciting part of the job, which is data oversight. I welcome the opportunity to work with AI, rather than compete with it, and ultimately derive more useful insights.

2. Why do you want to work at this company?

I saw on LinkedIn that you are also recruiting for new positions on the Stanford campus to support your new operations there. I read further about the new data center you are building there, which makes me excited because I know This means there will be opportunities to use data analysis skills to tackle real-world problems.

3. Tell me about a time you had to handle a conflict with your colleagues.

In my last job, I had a conflict with a colleague over the assignment of responsibilities for a critical project we were working on. We had different ideas about how to divide tasks, and tensions escalated as we struggled to find common ground. Recognizing the importance of resolving this conflict, I began having private conversations with my colleagues. I approached the discussion with an open mind, listened to their perspectives, and expressed my own concerns thoughtfully. During the conversation, we realized the problems caused by different viewpoints, so we integrated our doubts and found that we had the conditions to solve the problem together, so as to resolve the problem together.
